

High contrast Keyboards

Large print, high contrast keyboards are perfect for anybody who has a hard time seeing the letters on their computer keyboards. They are also great for anyone who works in low light conditions or is learning to type.

The Large Print keyboards come in 3 different colour combinations, white letters on black keys, black letters on yellow keys or black on white.

Certain colour combinations enable better detection and improved legibility of text. Brightness contrast, along with size and viewing distance, is the prime determinant of print legibility. High brightness contrast is created by some colour combinations but not by others. Independent research studies have confirmed by experiments showing black/white and black/yellow produce best legibility.

Zoomtext Keyboards

Next to the regular Large Print keyboards there are also special Zoomtext keyboards that have special function keys to control the Zoomtext magnification software from the keyboard. Zoomtext keyboards come in either black on yellow or white on black.
