

Magic Magnification & Speech Software

MAGic screen magnification software is an innovative Low Vision solution for computer users. By combining state-of-the-art magnification features with a screen reading speech option, MAGic helps people view information on their computer screen while hearing it through a built-in speech synthesizer.

With 45 magnification levels, MAGic magnifies the contents of your computer screen up to 36 times its actual size. Powerful colour enhancement features give you a choice of many low-glare, high-contrast combinations. Apply tinting, view the screen as shades of a single colour (monochrome), invert brightness and colours, and switch colours. These enhancements can be applied individually or in combination to precisely tailor the screen's appearance. Use full-screen mode or see both magnified and unmagnified areas of your screen simultaneously with partial-screen magnification modes: Lens View, Overlay View, Split View, and Dynamic Lens View.

Magic is available with and without speech. The speech version has the flexibility of two included text-to-speech software synthesizers: RealSpeak Solo and Eloquence. Choose the one that is right for your use. MAGic also provides a variety of speech settings that allow you to control the amount of speech you hear and the properties of the voices.

The Magic user interface.

With the unique tracking enhancement features of MAGic, follow the movement of your mouse, your cursor, and the application focus on the screen. Change the colour of these enhancements, apply transparency effects, adjust their size, and more to make navigating screens quick and easy.

Compatibility

Magic Standard is compatible with XP Home and Vista Home systems. Magic Pro is compatible with XP Pro and Vista Business systems.
