

Office OCR system

The OCR products are advanced portable CCTV solutions with the possibility to scan different kinds of printed documents. The MLS OCR concept allows you to easily access and process printed texts wherever you are. Our OCR technology is available in two different products: the OCR module and the Office OCR. The OCR module is used in combination with our popular product the Student Addition, while the Office OCR is used as a stand-alone unit.

Computer connection

The OCR products are connected to a laptop or desktop computer through a USB 2.0 port and all system functions are handled directly from the computer keyboard. The large space underneath the camera allows scanning not only of documents, but also of thick books, binders and medical packages, etc.

When the OCR module is combined with one of the MLS Student cameras, you can easily switch between the pictures from the two cameras with a simple keystroke on the computer keyboard.

The OCR camera allows easy and quick scanning of printed documents. The OCR processing converts the text into a computer font and displays it in a Reading Window. In the Reading Window, you can present the text in different high contrast modes, including false colours, and change the magnification without affecting the picture quality.

System requirements:

- Windows XP SP 2 or Vista
- USB 2 port
- Intel Pentium M processor 2.0 GHz, 512 MB RAM (2 GB recommended with Vista)

Features

- Review and select information before scanning it
- Automatic reading modes: word by word, scrolling line and scrolling column
- Weight OCR module: 300 grams
